

## Bug Reports

The project partner has reported issues with the context and memory with the application's chatbot. The bug involves the chatbot forgetting what steps it has already completed, especially in the cases of multistep processes, and being unable to recall short-term context. This causes responses which fail to take into account information which has already been provided/executed.

This is most likely an issue with the implemented Gemini 1.5 Model, which has reported issues with short-term memory and handling context. Fixes may include switching to other free models, such as updating to the Gemini 2.5 Pro, or other paid models. If this fails, it is possible issues lie within how chatlogs are handled within chatController.js
